

Trim PCB

Automatic placement and rotation of Ref.-des.:

TrimPCB will save valuable time and hundreds of CTRL-R clicks on every PCB you design. Trim PCB performs two of the most wanted (and still missing) functions in PADS PowerPCB:

1: Center and rotate ref.-des. in parts outline. By calculating the actual size of every ref.-des. text, this function can place the text exactly in the parts center. The rotation of the text is optimized to fit inside the outline.

2: Text-search and -replace to update dates, rev. numbers ect.

Ref.-des. adjustment:

Three ways of adjusting positions:

- 1/ Text centered in the outline.
- 2/ Text placed relative to origin.
- 3/ Text placed relative to outline-center.

Ref.des. rotation optimized based on the outline-shape.

Extensive setup to customize the function for your needs.

Text search and - replace:

Search and replace texts to update revision-numbers, dates ect.

System-requirements:
If PowerPCB runs - this will.
